

Mars degree-2 ($m=0$) tidal response, TASK-011 fitted model

$$k_2 = 0.169 \text{ (observed } 0.169 \pm 0.006) \quad h_2 = 0.3156 \quad l_2 = 0.0516$$

$m=0$ (zonal) pattern shown for a single-panel illustration; Love numbers for a spherically symmetric reference model depend on degree n only, not order m , so these amplitudes are exactly those of the real (longitude-varying) $m=2$ solar-semidiurnal tide.
